

1. Deepfake & Digital Media Auth

The rapid advancement of generative AI has blurred the lines between authentic digital media from manipulated content. Deepfakes and synthetic images pose significant risks to personal privacy, businesses, and digital trust.

Develop a solution capable of detecting deepfakes and synthetic media by leveraging AI/ML models, digital forensics, and blockchain verification techniques.

The platform should verify images and videos, provide a confidence score, and help users check whether the content is real or AI-generated before or after sharing it online.

2. AI-Powered Game Discovery Platform:

Finding the perfect game can be difficult, especially with thousands of titles available across different platforms. At the same time, creating a custom game often requires programming skills and game development experience. Advances in Generative AI make it possible to simplify both game discovery and game creation.

Develop an AI-powered platform that allows users to describe the type of game they want to play using natural language (e.g., "a multiplayer shooting game with futuristic weapons" or "a 2D puzzle game with increasing difficulty"). The platform should understand the user's request, search its game database and online sources to recommend the most relevant games, and, where feasible, generate a simple playable game based on the user's prompt. The solution should provide personalized recommendations, an intuitive user experience, and support a wide variety of game genres and play styles.

3. Open Innovation:

Innovation has the potential to address challenges across every domain. Participants are invited to identify a real-world problem in any field and develop an innovative, technology-driven solution that delivers measurable impact. Solutions may focus on, but are not limited to, domains such as Healthcare, Education, Agriculture, Finance, Sustainability, Smart Cities, Cybersecurity, Transportation, Accessibility, Gaming, AR/VR, IoT, Artificial Intelligence, Machine Learning, or Social Impact.

Note:

- Participants may use publicly available datasets, synthetic datasets or simulated wearable and smartphone data to train, validate and evaluate their machine learning models (for P.S 1,2)

Citizen reports are fragmented, manual prioritization delays response, and verification is missing.

• *There are no domain restrictions. Participants are free to choose any problem statement or create their own, provided the solution is innovative and addresses a genuine real-world need.*
(for P.S 3)

- Delayed response
- Manual prioritization
- Scattered reports
- Repeated duplicate issues
- Poor SLA visibility
- Weak resolution verification

End-to-End Smart City Command Pipeline

SUBMISSION GUIDELINES

Citizen / Image → AI Vision → Detection → Severity & Safety → Priority → Hotspot → Department → SLA → Verification

- AI-powered
- Real-time
- Priority-driven
- Location-aware
- Resolution-aware

Official PPT Template :

https://docs.google.com/presentation/d/1d2z9pNuRIUto/edit?slide=id.g3f93cbfcf5d_0_35

Submission Timeline :

- Submission Window Opens: 25th July
- Submission Deadline: 12th August 2026

No submissions will be accepted after the deadline.

Submission Requirements :

Every team must submit their project using the **official PPT template**. The following links **must be included inside the PPT**:

-  Project Documentation Link
-  GitHub Repository Link
-  Working Demo Link
-  YouTube Video Link (*Optional – Recommended: While optional, including a project explanation video will help the judges and mentors better understand your solution and may lead to bonus marks during evaluation.*)

Note: *Please do not submit these links separately. All required links should be embedded in your presentation.*

Working Demo & Project Explanation :

A **working demo** is highly encouraged and forms an important part of the evaluation. Even a basic functional prototype that demonstrates your solution is completely acceptable.

Additionally, if your team includes a **short video of any member explaining the problem statement, solution, implementation, and impact**, it will help the judges better understand your project and is highly appreciated. This explanation video should also be included in your PPT via a YouTube link.

Pothole detected with 95% confidence. Severity 8.8/10, Safety Risk HIGH, Priority 92/100.

Recommended department: ROAD MAINTENANCE.

Important Notice :

- AI Detection
- Priority Engine
- Department Recommendation

Submissions will be **evaluated on a rolling basis**. **your final PPT and project, the sooner your submit, the sooner you will receive your result earlier.**

Although all submissions received before the deadline, **encouraged to submit as early as possible** rather than waiting until the last minute.

Early Submission = Earlier Evaluation = Earlier Results

General Guidelines :

- Use only the official [PPT Template](#) provided by the organizing team.
- Ensure that all links included in the PPT are publicly accessible and working.
- Keep your documentation well-structured and complete.
- Make sure your GitHub repository contains the latest version of your project.
- Ensure your YouTube video is public or accessible via the shared link.
- Test your working demo before submission.
- Incomplete submissions or submissions with inaccessible links may not be considered for evaluation.
- Submit your final PPT on or before **12th August 2026 (11:59 PM IST)**.

We look forward to your innovative solutions and wish all participating teams the very best for **Brainwave 2026**.

Thank You - Team [Brainwave 2026](#)

Live dashboard monitoring with 83 total reports, 26 critical incidents, 18 high-priority issues, hotspot awareness, SLA tracking and map-driven dispatch

PROBLEM STATEMENT SET – 1

- 83 Total Reports
- 26 Critical
- 18 High Priority
- Civic Hotspots
- SLA Monitoring
- Live Map

1. Deepfake & Digital Media Auth

The rapid advancement of generative AI has made it easier to create authentic digital media from manipulated content. Deepfakes and synthetic images pose significant risks to individuals, businesses, and digital trust.

Develop a solution capable of detecting deepfakes and synthetic media by leveraging AI/ML models, digital forensics, and blockchain-based verification techniques.

The platform should verify images and videos, provide a confidence score, and help users check whether the content is real or AI-generated before or after sharing it online.
